UNDERSTANDING:

From studying these lessons, I learned how different Vue features work together to create an interactive product page. I understood how data defined in the data() function can be displayed and updated automatically in the HTML using Vue's reactivity system. Through list rendering with v-for, I learned how to display product details and variants dynamically instead of writing repeated HTML code. Event handling helped me understand how user actions, such as clicking buttons or hovering over colors can trigger methods like adding items to the cart or changing product images. I also learned how class and style binding can visually reflect data states, such as disabling buttons or showing out-of-stock images when a product is unavailable. By working with the cart logic, I understood how Vue updates values in real time and prevents invalid actions, such as removing items when the cart is empty. Overall, these files helped me connect theory with practice by showing how Vue manages data, user interaction, and UI updates in a simple but realistic example. This experience improved my understanding of how Vue can be used to build responsive and maintainable front-end applications using clean and structured code.
