UNDERSTANDING:

From studying these Vue lessons, I learned how a larger Vue application can be structured using components, computed properties, props, and custom events. I understood how separating logic into components like product-display and product-details makes the code more organized, reusable, and easier to maintain. Through props, I learned how data such as the premium status can be passed from a parent component to a child component, allowing the child to change its behavior, for example calculating shipping costs. Computed properties helped me understand how Vue handles derived data efficiently, such as dynamically updating the product title, image, stock status, and sale message based on the selected variant. I also learned how Vue reacts automatically when data changes, without manually updating the DOM. Most importantly, I understood how component communication works using custom events like add-to-cart and remove-from-cart, which allow child components to send information back to the parent. This helped me see how Vue manages interaction between different parts of an application in a clean and structured way. Overall, these files helped me move from basic Vue syntax to understanding how real Vue applications are built using component-based architecture and reactive data flow.
